

# Functional UAT Checklist: Attention Economy Revenue Simulator

## Phase 1: The Input Package (Mandatory)

Before starting an audit, the Pilot must provide the AI with the "Trinity of Context":

- **The Requirement:** POC #45 — Attention Economy Revenue Simulator. Simulates how user time and impressions convert into platform ad revenue. Features: Revenue Simulation Engine, KPI Cards, Platform Revenue Bars, Slider Controls, Ad Load & CPM tables, Creator Revenue-Share breakdown.
- **The Source:** Our World in Data, World Bank Data (synthetic/mock where live feed unavailable).
- **The Current State:** Screenshot of the current UI before audit session begins.

## Phase 2: Visual Audit Review (VAR)

Ensure the dashboard adheres to the intended design and Master Protocol.

**Layout Verification:** Verify the layout splits into the intended grid structure (approx. 70/30 split between main visualizations and the right sidebar context/controls on large screens). — PASS

**Color Scheme & Styling:** Confirm the application correctly applies the Obsidian DNA dark theme (bg #030712, slate-colored borders and text, with blue, red, and green accent colors where appropriate). — PASS

**Responsive Design:** Check on Desktop (sidebar to the right or left depending on CSS grid order logic). — PASS

## Phase 3: The Functional UAT Document

### 3.1 — KPI Cards

| Test Case ID | Test Category | Test Case                                                   | Expected Result                                                                                                                                          | Pass/Fail |
|--------------|---------------|-------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| TC_001       | KPI Cards     | Verify KPI cards render on initial page load                | At least 4 KPI metric cards are visible (e.g., Total Revenue, Daily Active Users, CPM Rate, Impression Count) without layout overflow or missing values. | pass      |
| TC_002       | KPI Cards     | Verify KPI values are non-zero on load                      | All KPI card values display numeric data greater than zero on initial render (not blank, NaN, or undefined).                                             | pass      |
| TC_003       | KPI Cards     | Verify KPI cards update when simulator sliders are adjusted | KPI card values recalculate and update in real time as the user moves the Ad Load or CPM slider controls.                                                | pass      |

### 3.2 — Revenue Simulation Engine (Sliders)

| Test Case ID | Test Category             | Test Case                                       | Expected Result                                                                                                                     | Pass/Fail |
|--------------|---------------------------|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|-----------|
| TC_004       | Revenue Simulator Sliders | Verify slider controls render on page load      | All simulator sliders (e.g., Ad Load %, CPM Range, Daily Active Users) are visible and interactive on first render.                 | pass      |
| TC_005       | Revenue Simulator Sliders | Drag the Ad Load slider to maximum value        | Platform revenue estimates update upward proportionally; the revenue bar chart reflects the increased ad load across all platforms. | pass      |
| TC_006       | Revenue Simulator Sliders | Drag the Ad Load slider to minimum (zero) value | Revenue estimates drop to zero or near-zero; the platform revenue bars collapse to empty/minimal state.                             | pass      |

| Test Case ID | Test Category             | Test Case                                       | Expected Result                                                                                                                  | Pass/Fail |
|--------------|---------------------------|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|-----------|
| TC_007       | Revenue Simulator Sliders | Adjust CPM Range slider upward                  | CPM-dependent revenue figures increase across all platform cards and the revenue bar chart updates to reflect the new CPM value. | pass      |
| TC_008       | Revenue Simulator Sliders | Verify slider values display as readable labels | Each slider shows its current value (e.g., '45%', '\$8.50 CPM') as a visible label or tooltip next to the slider handle.         | pass      |

### 3.3 — Platform Revenue Bar Chart (ECharts)

| Test Case ID | Test Category     | Test Case                                        | Expected Result                                                                                                                                   | Pass/Fail |
|--------------|-------------------|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| TC_009       | Revenue Bar Chart | Verify ECharts bar chart renders on initial load | The platform revenue bar chart (ECharts) renders successfully with at least 4 platform bars (e.g., YouTube, Meta, TikTok, Spotify) on first load. | pass      |
| TC_010       | Revenue Bar Chart | Hover over a bar to see tooltip                  | Hovering over any platform bar shows a tooltip with platform name, estimated revenue figure, and relevant metric (e.g., CPM or impressions).      | pass      |
| TC_011       | Revenue Bar Chart | Verify chart updates after slider adjustment     | After changing the Ad Load or CPM slider, the bar chart animates and updates bar heights to reflect the new revenue estimates.                    | pass      |
| TC_012       | Revenue Bar Chart | Verify chart bars are color-coded by platform    | Each platform bar uses a distinct color that matches the platform identity color or a consistent legend mapping.                                  | pass      |

### 3.4 — Platform Cards

| Test Case ID | Test Category  | Test Case                                             | Expected Result                                                                                                                                     | Pass/Fail |
|--------------|----------------|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| TC_013       | Platform Cards | Verify platform cards render with correct data        | Individual platform cards (YouTube, Meta, TikTok, etc.) are visible and each shows the platform name, revenue per user estimate, and ad model type. | pass      |
| TC_014       | Platform Cards | Verify creator revenue-share is displayed per card    | Each platform card shows a creator revenue-share percentage or absolute split figure (e.g., 'Creator gets 55%').                                    | pass      |
| TC_015       | Platform Cards | Verify platform cards update dynamically with sliders | Platform card revenue figures update in sync with slider changes, matching the values shown in the bar chart.                                       | pass      |

### 3.5 — Ad Load & CPM Data Table (TanStack Table)

| Test Case ID | Test Category | Test Case                                  | Expected Result                                                                                                   | Pass/Fail |
|--------------|---------------|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------|-----------|
| TC_016       | Data Table    | Verify TanStack Table renders on page load | The ad load and CPM comparison table renders with headers and at least 4 rows of platform data on initial load.   | pass      |
| TC_017       | Data Table    | Verify table columns include key metrics   | Table columns include at minimum: Platform, Ad Load %, CPM Range (\$), Revenue Per 1K Users, and Creator Share %. | pass      |

| Test Case ID | Test Category | Test Case                      | Expected Result                                                                              | Pass/Fail |
|--------------|---------------|--------------------------------|----------------------------------------------------------------------------------------------|-----------|
| TC_018       | Data Table    | Verify table rows are sortable | Clicking a column header sorts the table rows in ascending/descending order for that metric. | pass      |

### 3.6 — 'Why This Matters' & 'Who Controls the Rail' Panels

| Test Case ID | Test Category  | Test Case                                               | Expected Result                                                                                                                                              | Pass/Fail |
|--------------|----------------|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| TC_019       | Context Panels | Verify 'Why This Matters' panel is visible on load      | The 'Why This Matters' panel is visible and contains explanatory copy about the attention economy, ad revenue mechanics, and the Distribution & Demand rail. | pass      |
| TC_020       | Context Panels | Verify 'Who Controls the Rail' panel is visible on load | The 'Who Controls the Rail' panel displays platform/company names with their estimated market share or dominance indicators.                                 | pass      |
| TC_021       | Context Panels | Verify panel text is readable against dark background   | All text in both panels has sufficient contrast against the #030712 Obsidian DNA dark background (no illegible light-on-light or dark-on-dark text).         | pass      |

### 3.7 — Download Functionality

| Test Case ID | Test Category          | Test Case                               | Expected Result                                                                                                            | Pass/Fail |
|--------------|------------------------|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------|-----------|
| TC_022       | Download Functionality | Click the 'Download Sample Data' button | A CSV file download is triggered and the filename matches the project (e.g., attention_economy_revenue_sample.csv).        | pass      |
| TC_023       | Download Functionality | Verify downloaded CSV content structure | The CSV contains columns for Platform, Ad Load %, CPM, Revenue Per 1K Users, Creator Share %, and Data Source attribution. | pass      |

### 3.8 — Data Source Attribution

| Test Case ID | Test Category | Test Case                                       | Expected Result                                                                                                                                     | Pass/Fail |
|--------------|---------------|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| TC_024       | Data Sources  | Verify Our World in Data attribution is visible | The dashboard clearly labels data derived from Our World in Data with a source tag, footnote, or badge.                                             | pass      |
| TC_025       | Data Sources  | Verify World Bank Data attribution is visible   | World Bank-sourced metrics are clearly labeled with source attribution either inline or in a data sources panel.                                    | pass      |
| TC_026       | Data Sources  | Verify synthetic/mock data is clearly labeled   | Any data that is synthetic or mock clearly carries a label such as 'Synthetic', 'Simulated', or 'Well-labeled mock data' so viewers are not misled. | pass      |

## Phase 4: Static Data Feeds Verification

### 4.1 — Platform Revenue Feed

**Render Check:** Verify the platform revenue panel displays data for all included platforms (minimum 4: YouTube, Meta, TikTok, Spotify or equivalent) with revenue, CPM, and creator-share figures populated from the synthetic data layer.

### 4.2 — Our World in Data / World Bank Feed

**Render Check:** Verify that any global context data panels (e.g., internet user growth, global ad spend trends) render with correct values and correct data source labels (Our World in Data / World Bank).

#### **4.3 — Simulation Engine State Feed**

**Render Check:** Verify the slider state is correctly propagated to the revenue engine — adjusting any slider must produce a consistent update across KPI cards, the bar chart, platform cards, and the data table simultaneously with no stale/out-of-sync values.
